

# Cascading Style Sheets (CSS)

# Driving problem behind CSS

What font type and size does `<h1>Introduction</h1>` generate?

Answer: Some default from the browser (HTML tells **what** browser **how**)

Early HTML - Override defaults with attributes

```
<table border="2" bordercolor="black">
```

**Style sheets** were added to address this:

Specify style to use rather than browser default

Not have to code styling on every element

# Key concept: Separate style from content

Content (what to display) is in HTML files

Formatting information (how to display it) is in separate style sheets (.css files).

Use an element attribute named **class** to link (e.g. `<span class="test">`)

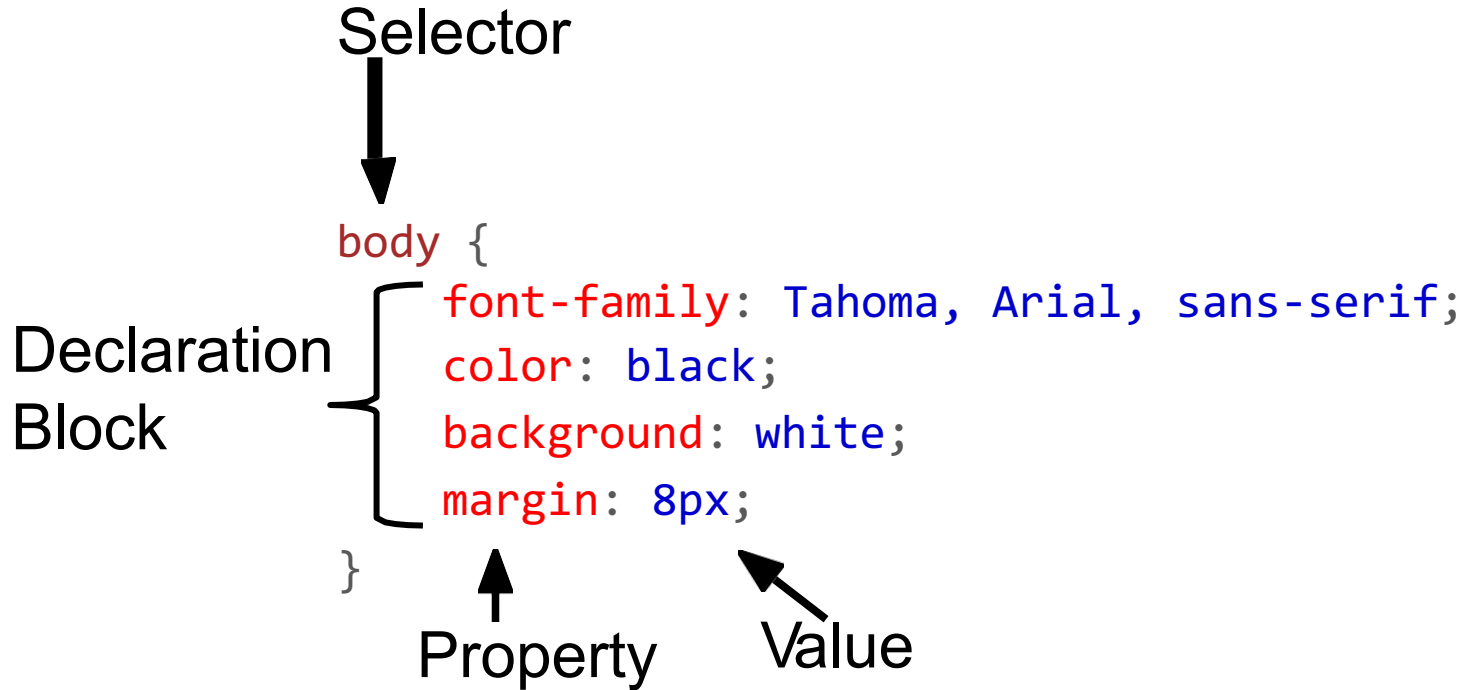

Result: define style information once, use in many places

Consider can you make all the text in the app slightly bigger?

Or purple is our new company color.

## DRY principle: Don't Repeat Yourself

# Style sheet contain one or more **CSS Rules**

CSS Selector	CSS	HTML
Tag name	<pre>h1 {   color: red; }</pre>	<pre>&lt;h1&gt;Today's Specials&lt;/h1&gt;</pre>
Class attribute	<pre>.large {   font-size: 16pt; }</pre>	<pre>&lt;p class="large"&gt;...</pre>
Tag and Class	<pre>p.large {...}</pre>	<pre>&lt;p class="large"&gt;...</pre>
Element id	<pre>#p20 {   font-weight: bold; }</pre>	<pre>&lt;p id="p20"&gt;...</pre>

# CSS Pseudo Selectors

**hover** - Apply rule when mouse is over element (e.g. tooltip)

```
p:hover, a:hover {  
  background-color: yellow;  
}
```

**a:link, a:visited** - Apply rule when link has been visited or not visited (link)

<pre>a:visited {   color: green; }</pre>	<pre>a:link {   color: blue; }</pre>
--	--

# CSS Properties

Control many style properties of an element:

- Coloring
- Size
- Position
- Visibility
- Many more: (e.g. `p: { text-decoration: line-through; }`)
- Also used in animation

## Color - Properties: color & background\_color

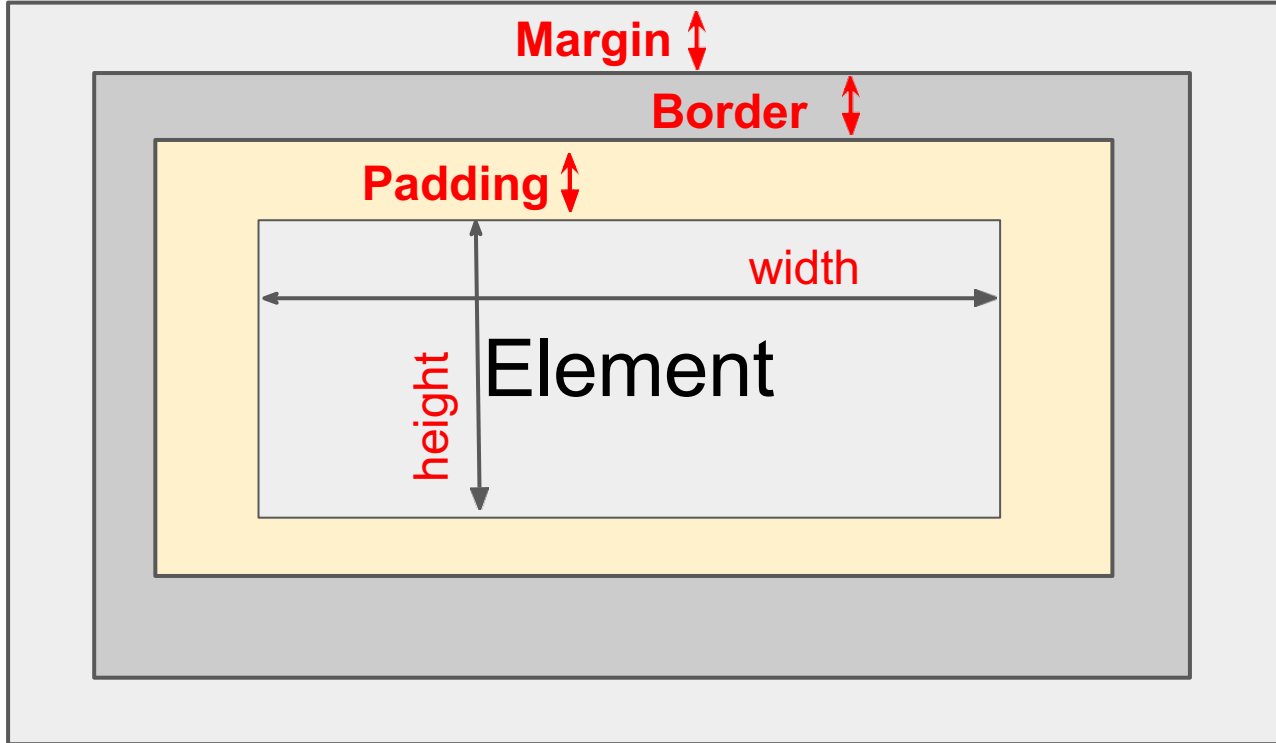

Must ultimately turn into red, green, and blue intensities between 0 and 255:

- Predefined names: red, blue, green, white, etc. (140 standard names)
- 8-bit hexadecimal numbers for red, green, blue: #ff0000 →   
R G B
- 0-255 decimal intensities: rgb(255,255,0) →   
R G B
- Percentage intensities: rgb(80%,80%,100%) →   
R G B

Example: `h1: { color: red; }`

# CSS Box Model

**Total element width =**  
width +  
left padding +  
right padding +  
left border +  
right border +  
left margin +  
right margin

Margin & Padding  
Transparent

# CSS distance units

Absolute	
2px	pixels
1mm	millimeters
2cm	centimeters
0.2in	inches
3pt	printer point 1/72 inch
Relative	
2em	2 times the element's current font size
3rem	3 times the root element's current font size

# Size Properties - Element, pad, margin, border

width - Override element defaults  
height

padding-top  
padding-right  
padding-bottom  
padding-left

margin-top  
margin-right  
margin-bottom  
margin-left

border-bottom-color  
border-bottom-style  
border-bottom-width  
border-left-color  
border-left-style  
border-left-width  
border-right-color  
border-right-style  
border-right-width  
etc.

```
p {  
  border: 5px solid red;  
}
```

# position property

`position: static;` (default) - Position in document flow

`position: relative;` Position relative to default position via top, right, bottom, and left properties

`position: fixed;` Position to a fixed location on the screen via top, right, bottom, and left properties

`position: absolute;` Position relative to ancestor absolute element via top, right, bottom, and left properties

Fixed position (0,0) is top left corner

# Some more common properties

`background-image:` image for element's background

`background-repeat:` should background image be displayed in a repeating pattern (versus once only)

`font, font-family, font-size, font-weight, font-style:` font information for text

`text-align, vertical-align:` Alignment: center, left, right

`cursor` - Set the cursor when over element (e.g. help)

# Element visibility control properties

`display: none;` - Element is not displayed and takes no space in layout.

`display: inline;` - Element is treated as an inline element.

`display: block;` - Element is treated as a block element.

`display: flex;` - Element is treated as a flex container.

`display: grid;` - Element is treated as a grid container.

`visibility: hidden;` - Element is hidden but space still allocated.

`visibility: visible;` - Element is normally displayed

# Flexbox and Grid layout

- `display: flex;` (Flexbox)
- `display: grid;` (Grid) newer layout method
  - Items flex to fill additional space and shrink to fit into smaller spaces.
  - Useful for web app layout:
    - Divide up the available space equally among a bunch of elements
    - Align of different sizes easily
    - Key to handling different window and display sizes
- Flexbox - Layout one dimension (row or column) of elements
- Grid - Layout in two dimensions (rows and columns) of elements
- Covered in discussion section

# Some other CSS issues

- Inheritance

- Some properties (e.g. font-size) are inherited from parent elements
- Others (border, background) are not inherited.

- Multiple rule matches

- General idea: most specific rule wins

`<span>Text1</span>`

`<span class="test">Text2</span>`

`span.test { color: green }`

`span { color: red }`

# Adding Styles to HTML

Separate style sheet (best way)

```
<head>
  <link rel="stylesheet" type="text/css" href="myStyles.css" />
  <style type="text/css">
    body {
      font-family: Tahoma, Arial, sans-serif;
    }
  </style>
</head>
<body>
  <div style="padding:2px; ... ">
</body>
```

Page-specific styles

Element-specific styles

```
body {  
  font-family: Tahoma, Arial, sans-serif;  
  font-size: 13px;  
  color: black;  
  background: white;  
  margin: 8px;  
}  
h1 {  
  font-size: 19px;  
  margin-top: 0px;  
  margin-bottom: 5px;  
  border-bottom: 1px solid black  
}  
.shaded {  
  background: #d0d0ff;  
}
```

CSS:

```
<body>  
  <h1>First Section Heading</h1>  
  <p>  
    Here is the first paragraph, containing  
    text that really doesn't have any use  
    or meaning; it just prattles on and on,  
    with no end whatsoever, no point to  
    make, really no purpose for existence  
    at all.  
  </p>  
  <div class="shaded">  
    <h1>Another Section Heading</h1>  
    <p>  
      Another paragraph.  
    </p>  
  </div>  
</body>
```

HTML:

# Example Output

## **First Section Heading**

---

Here is the first paragraph, containing text that really doesn't have any use or meaning; it just prattles on and on, with no end whatsoever, no point to make, really no purpose for existence at all.

## **Another Section Heading**

---

Another paragraph.

# CSS in the real world

- CSS preprocessors (e.g. less) are commonly used
  - Add variable and functions to help in maintaining large collections of style sheets
  - Apply scoping using the naming conventions
- Composition is a problem
  - It can be really hard to figure out what rule from which stylesheet is messing things up
